THE UNCERTAIN FUTURE

Vania Lara Oyarzun

The future is uncertain. It always has been. Paradoxically, we can only measure it by looking back, towards the past, and analyzing all the progress that we have achieved.

The main thing that has marked it is the advancement of technology. The machines and global computer networks have marked our lives, whether we want it or not. Efficiency and speed to bring off our work, in addition with the instant connection to the whole world, has allowed us to realize that limits do not exist. We can speculate about the future everything we want, including the unimaginable. I remember, for example when I was a child and I read a school article about the future, which said that it would be possible to phone and at the same time see the person through a camera. At that time I was 6 years old and I thought: "That is not possible. How could we do that?" And we can do that now! Nowadays it is completely normal for us! As well as thousands of other things.

Tomorrow the "humanized" robots will share daily tasks with us and they will be our best friends, listening to our problems and advising us. Will that be possible? I think so!

ROBOTS

Jiwon

If robots are given the ability to lead two-way communication on behalf of foreign instructors, the resulting in social cost savings would be enormous. Currently, practical robot technology is approaching the level of possible communication choices and voice recognition functions based on artificial intelligence, emotional expression considering each other, and body language. In particular, English-speaking countries are far ahead of other languages in the field of natural language processing, a key technology in robot-based language education. Therefore, the emergence of a foreign-language teaching robot is technically possible, and the English-speaking robot is the most likely item to succeed commercially.

If the robot is brought into the house, it will have an educational effect similar to having a foreign tutor. If we live with a robot that speaks English all day long, we will learn a simple English conversation, unless we are fools.

The interactivity of the robot itself, such as creating a sense of intimacy and awareness of life, creates a new combination of 'robot teacher interaction' by sharing the interactive communication caused by immersion of storytelling and foreign language learning.

Thus, the power of robot teachers is great. Make a foreign language recognized by sound and observe the level of learners. Performance of sensitive devices is also increased. Imagine the good news of a robot teacher who will make headlines for newspapers and social media in the near future.

THE MAKE-UP MACHINE

Elin Jiwon

Have you ever imagined a make-up machine which gives you make-up if you choose the style and put your face in the machine?and also a cooking machine which completes the food if you put every ingredient for making that food.

It seems really good for many women. If you have spent hard time doing make-up or preparing food and felt tired, then you need to read this!

As I said, the make-up machine and cooking machine can appear to us in 2050. Because our society is developing and evolving towards people.

Firstly, I want to tell you guys about the make-up machine. Many women probably can agree how much you can feel tired and bored about the make-up time if we need to do everyday. This machine can be used like this way. If you choose the style whatever you want and just put your face there, then it will give you make-up and you can take a rest during this time.

Next, the cooking machine is also that you can use easily. If you decided which food you want to make, then just put all the ingredients in the order and machine will finish it for you. It sounds awesome. Isn't it?

By the 2050s all this would be possible. Let's look forward to these.

MY ENVIRONMENT

Guido Altuzzara

Being in my early 30s and having had the new experience of living for a long period in a foreign country I came to see the world differently. This perspective, broader in many ways, has created a huge amount of questions about the world and myself.

Seeing so many different cultures, and by being exposed to society without my family's shell protection increases your sensitivity about the people around you. Also, I was able to acknowledge how lucky I am at different levels. This new understanding of myself in the world has led me to desire to become an active actor in the issues that vulnerable people experience. I think I would try to help close the gap for children that grow in hard environments as they are the real opportunity we all have to achieve real change into a better world for everyone. For that, I'm still redefining my role as an architect, which can be the key to pursuing this goal. So I am in a period of growth and transformation which is both exciting and terrifying. But I guess that's what makes life so beautiful.

DYSTOPIA VS UTOPIA

Мөнхбаяр Манлай (Mugi)

Just over a hundred years ago, some modern things were just a mere fancy imagination. And a couple more hundred years ago we believed that earth was flat. Our past is full of discoveries and inventions. Our ancestors did their best to make our lives better and made a lot of effort to make the world a better place. In most recent years this progress became even faster, but some people believe our future won't be good as it was. Because some people don't have faith in others or government politics that considers other countries, opposing political parties as a threat we may face a dystopian future. However some people don't think so, they believe our future will be even brighter than ever.

They believe the progress we made in our history is a great thing and in the future we will do it better.

Since we faced many problems like water shortage, climate change etc, we couldn't find the solution yet. But people around the world don't give up, they keep trying their best, and are still doing it. With these peoples' hope I believe our future will be brighter than ever and I think that has been our butter and bread since the beginning of our time.

LANGUAGES

Thunyapawn Sinthunon (Earth)

Dear Sir/Madam,

I write this letter to tell about languages in the future. Some countries, they use their language for community. The most popular language is the English language because they can use it for connecting with other countries. Nowadays many schools must teach the English language in courses and also increase another language for students who are interested in other languages. In the past, I studied only the English language but now they have to add the Chinese language in the course. In order to benefit, when we want to apply for some position in the famous enterprise, HR has to look at your ability first before appointing for your interview. Although many people can speak 3 languages, it isn't enough for the future. In the next 10 years, many people can speak more than 3 languages because we have to compete with each other for ourselves. Unless we study other languages, we will may be successful in our lives.

So I think learning more is useful because it is advantageous for me. If I can speak more than 3 languages, I am going to have more opportunities than other people who can speak only 2 languages. In addition, knowledge is endless to learn.

Yours Faithfully,
Earth

AWAKE BRAIN

Sona Pagacova from Sydney

Nowadays, in the 21st century in our global world and growing society we are under a lot of pressure to create a lot of useful things, which make our lives easier. Eventually, we hope that it will have a positive impact for our future. Who knows, maybe in 2050 it will be absolutely normal to order a pizza that will be delivered by a robot. The first thing to consider when discussing the future, is that technology is rapidly changing all work possibilities. Furthermore, it keeps our brains “awake” to learn a lot of new knowledge and improve our skills such as; programming, maths modelling, analysing, graphic design, blogging, creating websites and so on.

There is no doubt that, for a young generation, technology is more familiar, but it will be more challenging and demanding to be creative in many professions likewise; IT Solution Architect, Influencer- blogging , Analysis Manager e.g. Although some people say that, a few professions will be extinct; consequently, that means there will be a lot of free time for many people. Undoubtedly, people will start looking for a new option to spend their free time effectively for instance; to practice a yoga class, or Pilates, moreover they can become a lecturer of Thai chi. I strongly believe that, the future will bring a positive impact for our daily lives. I am really looking forward to it.

DREAMS AND GOALS

Anderson Steven Virguez Moreno

Nowadays, exist a lot of things that are worrying all of the people in the world, but the most concerning is the future, because it is in a state too difficult to imagine how it will be. For me, at this moment, my future depends on my skills, knowledge, and capacity of understanding. Having said that, everything will be done just for myself, no one can help me. I have so many wishes and a lot of goals, one of them is doing my Master's degree in manufacturing at Swinburne University or University of Technology Sydney. Although, in order to fulfill this goal, I have to push myself and get a good score in all of the bands on the IELTS test, which is the first step that I have to do to get closer to my goals.

The probability to fail or succeed is the same 50% / 50%, therefore, it is important that at every moment you have to feel optimistic, with good vibes and the attitude is the most important to get towards your dreams and goals. On the way you can find obstacles, which sometimes are the facts that you fall down, but you can continue, just stand up again and walk ahead, without thinking what kind of thing will be pass, just you have to think of fulfilling your dreams.

LIFE IN 2050

Francisca Antonietta Ulloa Medina

What will life be like in 2050 ? Life will be like TV show Jetsons? Let's see and found out.

When I was young, I thought the life in 2000 will would be completely different as than it's was., I had imagined life would will be just like Jetsons TV show; cars will be flying, food, meals and drinks will be just in a pill, you don't have to walk any part (just flying). But certainly like has not changed as I thought. So regarding that, do you think life will be so different in 2050 as it's now?...

Maybe in some particular aspect of life there will be some significant changes., I'll expected that all the phones call will be a projection analogous and you'll be able to touch or feel the smell of the person that you're talking to.

Also indoor farming will be massive and all over the place. They will be growing all the veggie and fruit in that case we don't have to worries about the weather impact and veggies / fruit would be cheaper.

I think pollution would be exist and even worst way than at the present. City would be saturated with stress people, running from one way to another like a robot, without much free time.

So do you think life in 2050 would be as Jetsons TV show?.... Gives them a second thought.

THE DIRECTION OF OUR FUTURE

Thitikorn Sangkaew (Gain)

"No man ever steps in the same river twice, for it is not the same river and he is not the same man" as Heraclitus said. The statement represents properly the fact that time appears to be unstoppable and unpredictable, both in all society and humanity. In other words, humans are constantly in such unstable circumstances that they have to be anxious towards prospective situations.

In modernity, a majority of the population tends to consider "the future" as the opportunity to change their lives and do new things, such as it will bring better life than the present or in the past, others still believe that change is not good for them; therefore, they need to stand still in their own worlds. Regarding uncertainty, a huge number of problems that we face at this moment is how we deal with this situation and what we can do to escape from the uncertainty in our lives.

It may be true that we cannot avoid time, with the same reason, we cannot escape from uncertainty especially when we face upcoming troubles.

Consequently, we have to prepare ourselves in order to confront such forthcoming problems that we possess enough options to solve them.

Furthermore, the only moment we can know and understand the situations that surround us, is the present; thus, "let's do our best at this moment" is the best way to be happy in life. Even if the future has a crucial influence on our lives, our own lives have a part in the direction of our future.

FASCINATING FUTURE

Cristian Alberto Villanueva Bueno

Many people dream and want to know "what is our future going to be like?" how is going to be our future". Is this going to be good or bad for the mankind?. That is very difficult to answer now , because there are a lot of possibilities. the possibility are a lot. But one thing is true, our technology is going to improve and maybe our life expectancy is going to be longer better. In the future we'll likely find the cure for many diseases. However we'll confront other problems such as over population and we'll don't we won't have enough food for all of us. So we will have to find the way for keep maintain our style of life current lifestyle.

Another important thing is learn how live together with other species in this world. We are polluting our world and with this damage a many others form of life in this planet. Will find the way to share with other species?

Will we stop the global warm?. This is good question because the people who control the world in this moment put first your economic interest over the nature.

Our technology our allow us travel faster and further away. The possibility to colonised other planets in this solar system could be true and with this find the solutions to many problems that we have in this moment.

One thing is a fact. Our future is going to be fascinating in one way ur other. Are we improve such as specie or going to die in the process. Only the future will tell us.

DINOSAURS

Diana Catherine Martinez Carrasquilla

I am a dinosaur lover., I think the best era in the world was the exciting paleontology. I know living with dinosaurs sounds crazy and many people guess it is madness, something like that, but now scientists are extracting dinosaur DNA to make it possible.

If you ask me about living with a pet dinosaur, for sure I say yes! But I guess will be dangerous, at least you have a tiny herbivorous dinosaur, otherwise you could be victim of carnivorous one.

The truth about Jurassic Park was is to prevent scientists making it possible, a dinopark and they want people to take control about experiments that human being can control it after that. However it will be great to discover the real genetic structure of about DNA, because it means we could repair damaged cells and avoid some illness or make something about the way people feel pain, maybe less pain, in this way, do you still think it is crazy?

We need to improve about genetic, and for me dinosaurs could be the "guinea genetic pig", and i wonder, why not? Dangerous but very satisfactory for dinosaur people its at the end we get this achieve. We could have the best or the worst result about this experiment, but if we discover thought the bad result something different it will be an archive as well, so always it could be a great thing for people.

Anyway, this is what happened when I let fly my mind, but I am sure while I am dreaming about pet dinosaur scientist are making something possible, otherwise they are just finding a cure for some illness something great as well and may be for that time I could need it because I going to be old, just in body but old delicate body for the age.
